

CSB

STUDENT GUIDE

Department of Chemical and Systems Biology
Stanford University School of Medicine
2018-2019

Welcome! This guide lists the requirements for selecting rotations and coursework, passing the qualifying exam, and receiving a Ph.D. degree in Chemical and Systems Biology.

Rotations:

All 1st year graduate students take 3 quarter-long research rotations of their choice. Our goal is to expose students to foundational chemical, systems and cell biology concepts and to teach students how to plan and execute innovative biomedical research.

The first 2 rotations (usually in the fall and winter quarters) must be in one of the laboratories of the CSB faculty (Chen, Cimprich, Ferrell, Jarosz, Meyer, Mochly-Rosen, Qi, Wandless, or Wysocka). The goal is to introduce students to the unique training and research environment that the CSB department offers. For the 3rd (spring) rotation, students can rotate inside or outside the CSB laboratories.

Students are required to give an approximately 12 minute long presentation about their rotation project at the end of each of the first three quarters in the Science Circle Forum series (aka Pizza Talks), which meets Tuesdays at noon.

You may discuss potential rotations with CSB faculty at any time, even before you come to Stanford, but we request that you finalize your first and second rotation laboratory only after the Departmental Retreat, which is typically held shortly before classes start in the fall quarter. The Retreat will give you a chance to meet people from different laboratories and to learn more about potentially interesting rotation projects you may not be aware of. Short talks and poster sessions at the retreat offer excellent opportunities to see which types of research projects are currently active in the labs.

Before finalizing the second and third rotation laboratories, students meet individually with the CSB Advisory Committee (currently James Chen and James Ferrell) to discuss whether the rotation will be a good match for the student's educational goals.

Students rotating in labs within the department sign up for the corresponding faculty member's CSB 399 section Sign up for whatever number of units brings your unit total for the quarter to 10. Students rotating outside the department sign up for James Ferrell's CSB 399 section 05 and have their research advisor submit a grade via email to James Ferrell for submission in Axess.

We limit the number of rotating students in the same laboratory in any one quarter to two to ensure that students have a chance to closely interact with the faculty during the rotation. Incoming students are sometimes concerned that this might mean they will be unable to rotate in some laboratory they are interested in. We will help make sure that if you do not get your first-choice rotation in the fall, you will in the winter or spring.

Selection of thesis laboratory:

Selection of a thesis laboratory should be initiated by the student by discussing projects with a potential Ph.D. advisor, usually toward the end of the spring quarter. Joining a lab is done by mutual consent. If you are unclear whether you have found the lab you want to

join, it may be advisable to take a fourth (summer) rotation. Students must join a laboratory by the end of summer quarter.

The majority of our students historically have chosen thesis labs within the CSB department. However, a student may choose any lab at Stanford for his or her Ph.D. research. We appreciate that interests change, and that a CSB lab may not be the best home for every student. Students planning to join an outside lab and wishing to remain in the CSB program will be asked to write a one page summary of the proposed thesis project. The primary CSB faculty, in consultation with the proposed advisor, will determine whether the outside laboratory and thesis project aligns with the CSB department's mission.

If a majority of CSB faculty determine that the laboratory or project is not a good match for CSB (for example, if the department's expertise would not allow us to effectively evaluate the proposed research), or if a student would not be able to actively participating in the department's seminars, Pizza Talks, retreat and other activities, then the student will be asked to transfer to a Ph.D. program that offers a better environment for them.

Regardless of what laboratory you join, if you are part of the CSB program, you are required to attend throughout your thesis the departmental Pizza Talks, and the CSB annual retreat as well as departmental seminars, symposia and social events.

Quarterly student meetings during the first 2 years:

At the end of each quarter, 1st and 2nd year students meet with the Student Advisory Committee to discuss potential issues with the program, issues with host laboratories, classes, qualifying exam and career planning. This is also a good meeting to discuss ideas about student activities as well as additions or changes to the program. Students are also encouraged to meet with the Student Advisory Committee members or the Department Chair individually if any issues come up throughout the year.

In addition, each 1st and 2nd year student will be assigned a faculty advisor who the student can contact for advice about rotations, host laboratory issues, career planning and personal issues. Please feel free to contact your advisor and also Jim Ferrell, James Chen or Elizabeth Kay to discuss program, personal or other issues as they come up.

Coursework:

You will select courses in an individual quarterly meeting where you discuss with James Ferrell and James Chen your training goals and research interests. Our goal with the classes is that you gain a basic knowledge in the fields of systems biology, chemical biology and cell regulation to be able to understand research seminars and papers in the biosciences. In addition, we will make sure that your curriculum is filling critical training holes you may have and also make sure that you gain the expertise you need for your planned thesis research. Please ensure that your units add up to 10 in each quarter (use CSB 399 to reach 10 units). After the second year, students focus on research and typically fill their coursework only with CSB 399 units. After 3.5 years, students transfer to a terminal graduate student status, which reduces the tuition cost.

Coursework to be completed within the first two years:

Fall Quarter, Year 1

BIOS 200: Foundations in Experimental Biology
BIOS 204: Practical Tutorial on the Modeling of Signal Transduction Motifs
CSB 201: Bootcamp
CSB 270: Research Seminar
CSB 399: Graduate Research

Subsequent Quarters

CSB 270: Research Seminar (Fall, Winter, and Spring)
CSB 399: Graduate Research (Fall, Winter, Spring, and Summer)
MED 255: The Responsible Conduct of Research (Fall, Winter, or Spring)

Plus:

One Chemical Biology Course:

CSB 220: Chemistry of Biological Processes
OR
CSB 260: Concepts and Applications in Chemical Biology

Two CSB Electives chosen from:

CSB 210: Cell Signaling
CSB 221: Methods and Logic in Chemical and Systems Biology
CSB 222: Imaging: Biological Light Microscopy
CSB 240A: A Practical Approach to Drug Discovery and Development
CSB 240B: A Practical Approach to Drug Discovery and Development
CSB 242: Drug Discovery and Development Seminar Series
CSB 245: Economics of Biotechnology
CSB 250: The Biology of Chromatin Templated Processes

One Additional Elective. This may be an additional CSB course (listed above) or a substantial (ie.3-5 unit) course offered by another department. Popular electives include:

BIOC 224/BIO 214/MCP 221: Advanced Cell Biology
BIOC 241/BIOE 241/BIOPHYS 241/SBIO 241: Biological Macromolecules
BIOS 221: Modern Statistics for Modern Biology
BIO 271/CSB 271: Principles of Cell Cycle Control
DBIO 210: Developmental Biology
GENE 205: Advanced Genetics

Other electives are possible with approval from the Student Advisory Committee.

Qualifying exam:

The CSB qualifying exam must be taken before the end of the second year (before the fall quarter that starts in September). Students should make sure that they have fulfilled all course requirements before scheduling the exam. In rare circumstances, an extension of the exam date can be requested and approved by the CSB department chair.

The purpose of the qualifying exam is to determine whether the student is ready to carry out their Ph.D. thesis project. This comes down to four fundamental questions:

Has the student identified a good problem to work on? Is the question being addressed (or, in the case of more technological projects, the technology being developed) important, or is this incremental, “me-too” work?

Does the student have the knowledge required to successfully carry out Ph.D. research? Does the student have sufficient general background knowledge—the type of information one typically obtains from courses and review articles—for the research project? Does the student have sufficient expert-level knowledge—the more focused but deeper knowledge one typically obtains from critical reading of the primary literature—for the project?

Is the research plan a good one? Is the approach direct, feasible, and likely to be definitive? How will the work be followed up if the expected results are obtained, and how will it be followed up if they are not? What are the most likely obstacles? Is there a Plan B (and C and...)?

Is the student likely to make reasonable progress in a timely fashion? A logical research plan is important for a successful Ph.D. thesis. So is the ability to get things done. Does the student have the preliminary results in hand to indicate that progress has been made, and will continue to be made?

Both the written thesis proposal and the oral part of the qualifying exam contribute to the qualifying exam committee’s assessment of the student’s performance.

The CSB qualifying exam lasts approximately 2 hours and is attended by the student and three eligible faculty (they have to be tenure track and on the Academic Council), of which at least 2 need to have a primary appointment in the CSB department. The exam committee is chosen by the student in consultation with the thesis advisor. The student has to ask one of the two CSB faculty members on the committee to be the qualifying exam chair in advance of the meeting. The thesis advisor must be present at the beginning of the exam and provide background about the student before leaving the room. In special cases, the thesis advisor may send instead a written report about the student to the three members of the exam committee.

Students present a research proposal orally and in writing. The written thesis proposal should be 5 pages (one inch margin; single line, 11 or 12 pt; Abstract, Specific Aims, Background, Research Plan and Time Line for completion of each aim; Figures are encouraged). The written report must be received by the committee no later than 7 days before the exam, or the exam is canceled. During the exam, the committee will discuss the thesis proposal with the student and ask the student questions about the proposed work, the background in the field, and other relevant scientific topics.

The student will leave the room at the end of the exam and the three committee members will then decide by majority vote either (a) to pass, (b) to conditionally pass or (c) to fail the student. The student will be informed immediately after the vote whether he or she passed, conditionally passed or failed. If a student passes or conditionally passes, the student will write a one page report within one week summarizing the suggestions from the committee. This student report will first be sent to the committee members for additions and corrections. Once approved by the committee, the report has to be sent to the thesis advisor and Elizabeth Kay and the student is expected to discuss the points raised by the committee with the advisor. Only after a pass decision and the approval of the student report will the student become a Ph.D. Candidate.

A conditional pass can either include a requirement for a rewrite of the proposal or a requirement for an oral re-examination. After a conditional pass, the committee members can only be changed with the agreement of the CSB department chair. If an oral examination is required with the conditional pass, it must be completed within 6 months of the first examination. A final decision has to be made at this oral re-examination. There is only one chance to pass an oral re-examination. If the student passes the re-examination, he or she writes again a report and has it approved by the committee as at the first one. A re-writing of the proposal involves the submission of a revised proposal and requires approval by the committee. In some cases, this may involve more than one round of changes. Also when re-writing is required, the student must pass in 6 months or less from the initial examination date. In all cases, a final pass or fail decision for the CSB qualifying exam has to be made before the end of winter quarter of the third year. Finally, in the case of a conditional pass, the final pass decision is only made after at least two of the three committee members have approved the revised proposal and the revised student report.

If the student fails, he or she must leave the graduate program. In consultation with the committee, the committee chair will write within a week a report to the student, the advisor and the department chair stating the reasons for the fail decision. The student has the right to appeal a "fail" to the department chair. Such an appeal must be made in writing within one month of the fail decision. In consultation with the CSB department faculty, the chair then has the option to either let the fail decision stand or to schedule a re-examination with the same or different faculty. If approved by a majority of the committee and the chair of the CSB department, a student leaving the graduate program may be qualified to obtain a master's degree.

Miscellaneous: Fellowship applications, ongoing requirements, conferences and authorship

Students in the CSB program have to apply for possible funding from external and internal sources such as NSF, NIH, Bio-X and others. Each eligible student has to apply to NSF in the fall quarter. Please work on your proposal when you start with the first rotation. We will assign also a CSB faculty, student or postdoc to make recommendations for improvements. To have a good chance, you need to finish a first draft several weeks before the deadline. After the second year, we also request that all eligible students take a training class and apply for an NIH fellowship even if they have or had funding before. These fellowship

applications are both a good learning experience and, if funded, are also a good addition to your CV.

Starting in the 2nd year, students give every year a 30-minute presentation of their progress to the department at the Tuesday Pizza talks. They also must attend the retreat and present a poster or give a talk. Furthermore, students must attend the departmental CSB Cutting lectures and departmental symposia; speakers for these talks are selected by students, postdocs and faculty with an emphasis on showcasing speakers who can explain their work to a broad audience. We also encourage students to meet with speakers after the seminar for lunch (there is a signup email before each visit). We ask students for input about selecting potential speakers and make sure that we have a few student-invited speakers every year. We also encourage students to attend department social events: a Holiday party in December, a summer barbeque in June, outdoor game and sports events in nearby parks in spring and fall as well as happy hours in the summer.

While covering the cost of conferences is the responsibility of the thesis laboratory, students can get one-time in their Ph.D. career support from the department of up to \$1500 to attend a conference where they will give a talk or present a poster. Please make a request to Elizabeth Kay. We encourage students to attend conferences at least once a year starting in the 3rd year of their thesis.

Authorship and publications:

It is not uncommon that there are different opinions about the order of authorship and the inclusion of authors on publications. We recommend that you discuss authorship early in a project—if at all possible, before a publication has been submitted. A good strategy is to periodically discuss authorship both with your co-workers and with the thesis advisor as a project advances since the authorship may change as contributions are changing.

Contributions to a paper can include significant experimental or theoretical work as well as ideas or unpublished critical reagents or methods. If there is no satisfying solution after such discussions, you should discuss the issue with one or more members of your thesis committee. If there is still no resolution, you may contact the department chair. A final decision may in some cases involve the consultation of an outside faculty to help clarify the relevance of different contributions.

Committee meetings are every 6 months starting after the qualifying exam:

Committee meetings are the best opportunity for you to get feedback about your progress and to get second opinions about which types of experiments you should pursue to answer the questions you are trying to address in your thesis. To provide you with regular input, we mandate that you schedule committee meetings every 6 months after the qualifying exam. Each of these meetings should be scheduled to be 90 minutes long and should include 4 faculty members counting the thesis advisor (faculty on the committee do not need to be tenure track). At least one of the four faculty members has to be a primary faculty in the CSB department but the composition can be different from that in the qualifying exam and can also change during your thesis work as you may need to pursue different directions. In rare occasions when scheduling is difficult, not all members have to be present and you can meet with missing members separately. The committee is tasked to

give you advice about your experiments, future directions, make recommendations about attendance of conferences, career plans and more personal laboratory issues. Each meeting should include a time plan to ensure that the thesis project can be completed within less than 5.5 years. At the beginning of each meeting, the student will exit the room to allow for a discussion between the advisor and the rest of the committee. A few minutes before the end of the meeting, the advisor is asked to leave the room to allow for the student and the rest of the committee to discuss issues about the lab, potential personal issues, training opportunities and to discuss possible differences in research goals or issues relating to authorship. Meetings become more frequent in case the thesis is not completed by 5.5 years. If a committee meeting is not completed by August 31st, an enrollment hold will be placed on the student's account and may delay graduate funding.

Following the committee meeting, as with the qualifying exam, the student is required to summarize the discussion and formulate a revised plan for subsequent work. This summary should be discussed with the advisor and sent to the committee members within one week for comment. A final copy of the report will need to be submitted to Elizabeth Kay.

Ph.D. exam:

Upon completion of your experimental and analysis work, you will be writing a thesis and will be orally defending your thesis to the department and University. The decision to schedule an oral defense requires the support of each member on the committee including the thesis advisor. The University mandates the format of the defense as described at <https://studentaffairs.stanford.edu/registrar/students/dissertation-thesis>. In short, the 4 members of your thesis committee are typically also the "Oral Examination Committee" for your thesis defense. We request however that the oral examination committee needs at least 2 primary CSB faculty (all faculty have to be tenured or tenure track, members of the Academic Council). If only one CSB faculty was on your committee, a CSB faculty has to be added. In addition, you will also need a committee chair. The thesis defense chair has to be from a department other than CSB and the home department of your thesis advisor. Potential conflicts about scheduling the thesis defense should be resolved in discussions between the student, advisor and committee, or, if requested, in consultation with the CSB department chair.

We would like to see a mean time to degree in the program of 5.5 years or less, which means that you should defend your thesis typically around the end of the 5th year to allow for a writing quarter and a potential 3 month delay to the end of a quarter when the degree is actually granted. At the same time that we expect a time to degree of less than 5.5 years, we expect that each student complete for their thesis one first-author paper. By the time you are scheduling your thesis, this paper should be accepted for publication.
